IMPORTANT DISCLAIMER

This guide and the tools it describes are for educational purposes only. They are not investment, tax, legal or financial advice, and nothing in them is a recommendation to buy or sell any security, option or strategy. They do not account for your objectives, financial situation or risk tolerance. Options and short-term trading involve substantial risk and are not suitable for all investors; you can lose more than you expect, quickly. The tools compute their figures automatically from third-party market data. Data can be delayed, incomplete or wrong, and the models behind gamma, implied volatility and trade-side estimates rest on assumptions that may not hold. Examples that use the ticker XYZ are hypothetical illustrations, not real trades or prices. Past market behavior does not guarantee future results. Always confirm prices with your broker before acting, and consider consulting a qualified, licensed professional.

Market data in the live tools is provided by Massive (formerly Polygon.io). Massive is not affiliated with, and does not endorse, Market Unclouded or this guide. Ticker symbols that appear in screenshots are shown to illustrate how a tool displays data, not as recommendations. All trademarks belong to their respective owners.

2	Clear View: how to read it
3	Putting it to work
A	Quick reference, glossary and methods

MORE GUIDES

There is one short guide for each live tool. The complete **Live Market Tools** playbook covers Options Flow, Gamma Levels, the Gap Scanner and the Volatility Screener together, with a daily routine that uses them in order. All guides are at marketunclouded.com/tools/guide.

CHAPTER 1

Before you start

What the tool covers, where its numbers come from and how fresh they are.

Clear View shows your tickers, the day's top gappers and the Gamma Levels names on one row each, with what Charts, Expected Move, Gamma Levels, Options Flow, the Gap Scanner, the Volatility Screener and Options X-Ray know about them. It is included with a Live Tools subscription.

At a glance

Answers	Where does each of my tickers stand right now?
Covers	Your watchlist, the day's top gappers and the Gamma Levels names
Updates	Every minute while the page is open
Look at	Today, Nearest levels, Expected move, Options

The data

The tool uses market data from **Massive** (formerly Polygon.io). It reads the saved results of the other live tools, so each reading matches what those tools show, and works out today's intraday levels and the nearest daily zones from price bars.

When it refreshes

The rows reload every minute while the page is open. Today's levels come from 1-minute bars, the tools behind the options readings refresh every few minutes in market hours, the market regime updates after the nightly run and Options X-Ray scans after the close. The page also reloads its data on its own while you have it open, so you never need to refresh.

Reading the page

Badges and tiles

- **Updated** shows the time of the latest data: a green dot means fresh, grey means more than about 12 minutes old.
- The coloured tiles answer the page's main question at a glance: green for gains or dampening, red for losses or amplifying, gold for the current price.

Charts and tables

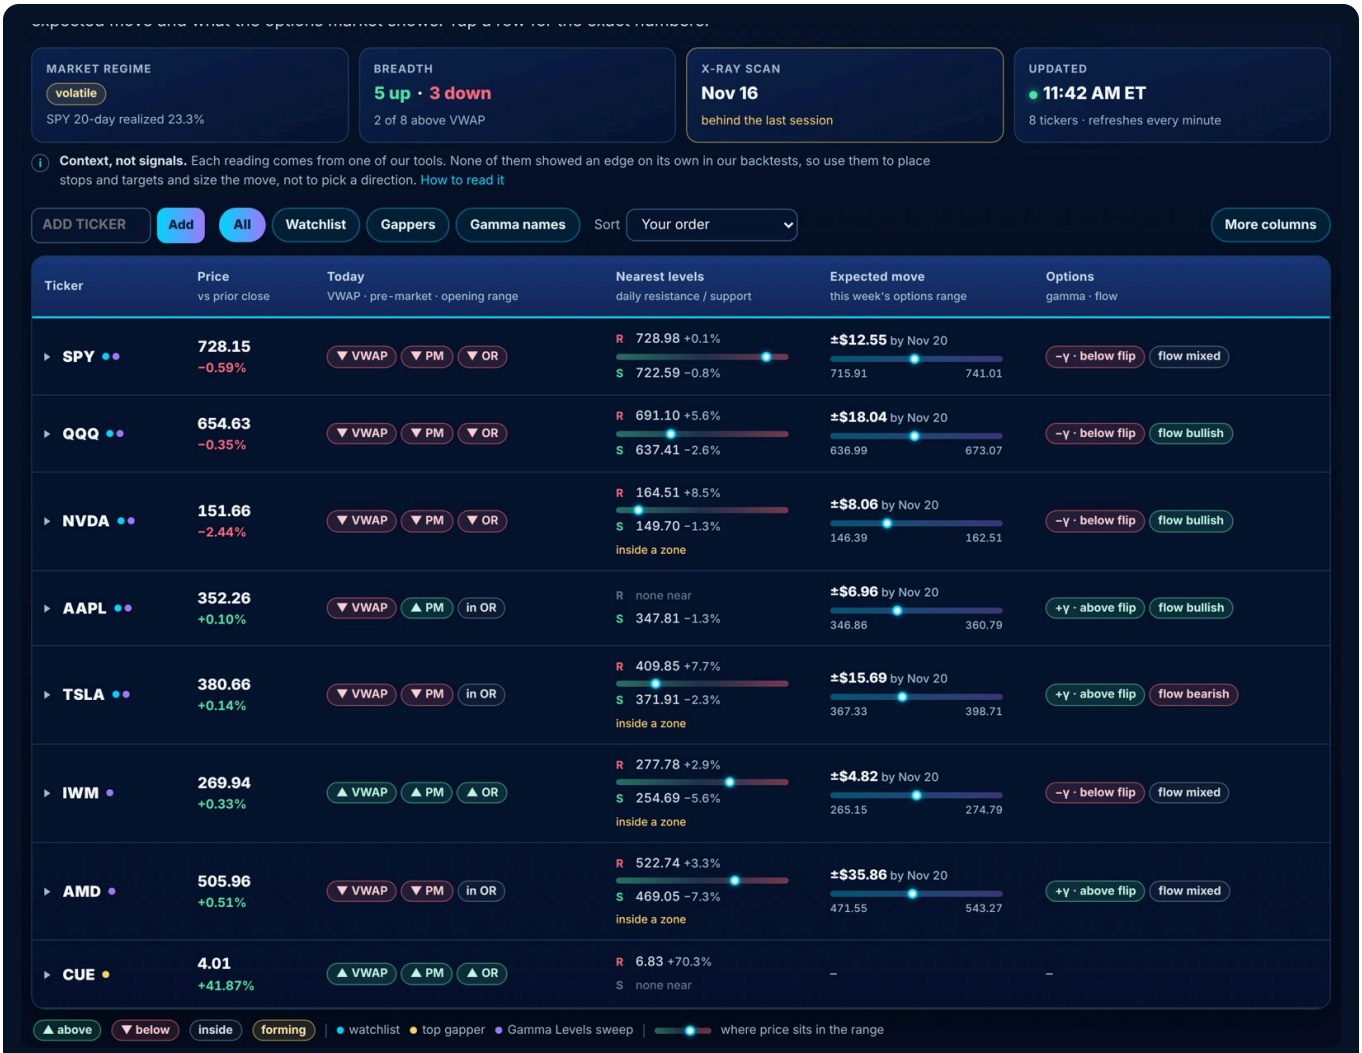

- Hover over any bar, dot or line for exact values. A gold dashed line marked **Now** is the current price.
- Click a column header to sort; the highlighted pill above a table is the active filter.

CHAPTER 2

Clear View

Where does each of my tickers stand right now?

Clear View is the place to start. It puts every live tool's reading for your tickers on one row: where price sits against today's intraday levels, the nearest daily support and resistance, the move the options are pricing for the week and what the options market shows. Tap a row and it opens to the exact numbers, with links to the chart and the option chain.

Clear View at 11:43 AM ET on Wednesday, November 18, 2026. Real data from Massive, shown to illustrate the layout; not a recommendation.

The summary tiles

Tile	Meaning
Market regime	SPY's 20-day realized volatility: **calm** under 12%, **normal** 12–20%, **volatile** over 20%. It updates after the nightly run.
Breadth	How many of the rows on screen are up and down from the prior close, and how many trade above their VWAP.

X-Ray scan	The date of the latest Options X-Ray scan, which runs after the close. Gold with **behind the last session** means the rich and cheap counts come from an older scan.
Updated	When the rows were last computed. The page reloads them every minute while it is open.

Which tickers appear

Your watchlist (the one on My Watchlist and the Charts page, saved in this browser) plus any ticker you add here, the day's top gappers from the Gap Scanner, and the names the Gamma Levels sweep covers. A coloured dot after each ticker shows where it came from: cyan for your watchlist, gold for a top gapper, purple for the Gamma Levels sweep. Use **All**, **Watchlist**, **Gappers** and **Gamma names** to filter, and **Sort** to order the rows by today's move, the gap, the closest level or the alphabet.

Reading a row

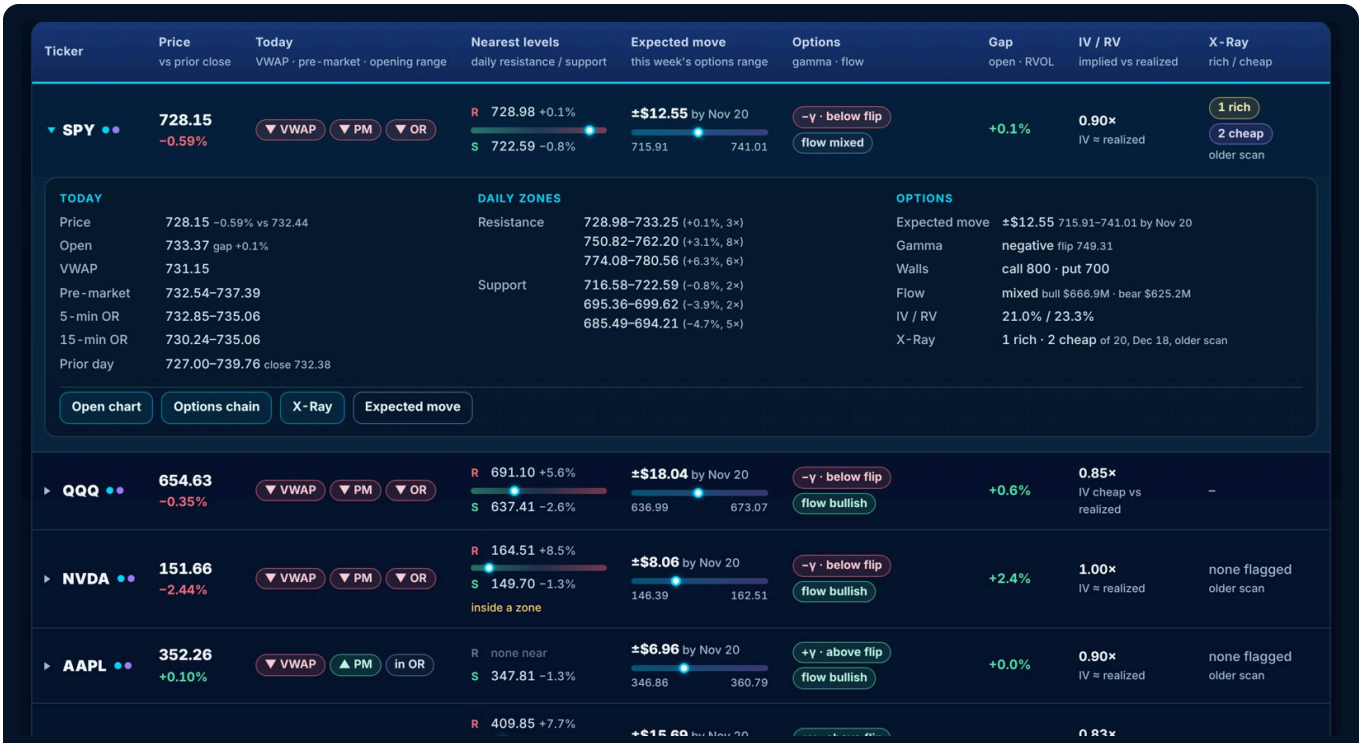

Column	Meaning
Price	The latest price and its change from the prior close. Before the open, after the close or overnight it says **pre-market**, **after hours** or **overnight**.
Today	Three chips: price against today's **VWAP**, against the **pre-market** high and low (PM) and against the 15-minute **opening range** (OR). Green ▲ means above, red ▼ below, grey means inside. Gold **OR forming** means the opening range isn't finished yet.
Nearest levels	The closest daily resistance zone above (R) and support zone below (S), each with its distance from the price. The bar between them shows where price sits in that range. **Inside a zone** means price is trading in one right now; **none near** means there is no zone on that side within reach.
Expected move	The at-the-money straddle for the next weekly or monthly expiration, in dollars, with the low and high ends of the range. The dot marks the price inside that range.
Options	Dealer gamma, **+γ** positive or **−γ** negative, and whether price is above or below the gamma flip (from Gamma Levels). Then whether today's flagged options trades lean **bullish**, **bearish** or **mixed** by premium (from Options Flow).

More columns (off until you turn them on)

Column	Meaning
Gap · RVOL	The open's gap from the prior close and relative volume, from the Gap Scanner.
IV / RV	30-day implied volatility divided by 20-day realized volatility, from the Volatility Screener. At 1.2× or more it reads **IV rich vs realized**, at 0.85× or less **IV cheap vs realized**.
X-Ray	How many of the roughly one-month contracts Options X-Ray flags as **rich** or **cheap** in its latest scan.

Clear View remembers your filter, sort and More columns choice in this browser. Gamma, flow, volatility and X-Ray cover the names those tools track; other tickers show a dash.

Tap a row for the exact numbers

SPY opened, with More columns on, at 11:43 AM ET on November 18, 2026. Real data from Massive, shown to illustrate the layout; not a recommendation.

The open row lists everything behind the chips: the open and its gap, VWAP, the pre-market range, the 5- and 15-minute opening ranges and the prior day's range; up to three daily zones on each side with their distance and how many times price touched them; and the expected move, gamma flip, walls, flow premium, implied and realized volatility and the X-Ray counts. The buttons open the ticker in Charts, the Options Chain, Options X-Ray and Expected Move.

Worked example (real data)

EXAMPLE · SPY AT 11:43 AM ET, WEDNESDAY NOVEMBER 18, 2026

- **Price:** $728.15, down 0.59% from the prior close of $732.44, after opening at $733.37.
- **Today:** ▼ VWAP, ▼ PM and ▼ OR. Price was below VWAP ($731.15), below the pre-market low ($732.54) and below the 15-minute opening range low ($730.24).
- **Nearest levels:** resistance at $728.98 (a zone up to $733.25, 0.1% above) and support at $722.59 (a zone from $716.58, 0.8% below).
- **Expected move:** ±$12.55 by the November 20 expiration, from $715.91 to $741.01.
- **Options:** negative dealer gamma with price below the gamma flip at $749.31; call wall 800, put wall 700. Flow was mixed: $666.9 million bullish premium against $625.2 million bearish.
- **Market:** the regime was volatile, with SPY's 20-day realized volatility at 23.3%, and 2 of the 8 rows on screen traded above VWAP.

How to read it: SPY had slipped under every intraday reference and sat just below a resistance zone that held VWAP and the opening range. The next support zone sat near the low end of the expected move, and negative gamma below the flip means dealer hedging can stretch moves. None of that says which way it goes next. It gives a trader a map: a stop belongs on the far side of the $728.98–$733.25 zone, the support zone and the $715.91 edge are the realistic targets, and the size of the position should allow for a ±$12.55 week.

How traders commonly use it

1. **Start the session here.** One look shows which tickers are above or below their morning levels and which are close to a daily zone.
2. **Sort by Closest to a level.** The names trading at support or resistance come to the top: that's where stops are tight and the risk is easiest to define.
3. **Open the row, then the chart.** Check the exact zone, the opening range and the walls before you plan a trade, then use Charts for the entry and the Options Chain for the strikes.

CONTEXT, NOT SIGNALS

- Each reading comes from one of our tools, and none of them showed an edge on its own in our backtests. Use them to place stops and targets and to size the move, not to pick a direction.
- Pre-market and opening-range levels fill in a few tickers at a time after the page loads.
- The X-Ray counts come from the last after-the-close scan; check the X-Ray scan tile for its date.

KEY TAKEAWAYS

- One row shows today's position, the nearest daily levels, the expected move and the options picture for each ticker.
- Green ▲ above, red ▼ below, grey inside, gold while the opening range is forming.
- Tap a row for the exact numbers and the links to Charts and the Options Chain.

CHAPTER 3

Putting it to work

Where it fits in the day, what to pair it with, and how to keep risk in check.

When to use it

Before the open to see where your names sit against the pre-market range, in the first hour as the opening range forms, and any time you want to know which tickers are at a level.

Pair it with the other tools

Tool	Question to ask
Unclouded Charts	Tap Open chart to see the zones, trendlines and options levels on the candles.
Options Chain	Tap Options chain to see the strikes, the walls and today's flagged trades.
Gap & Mover Scanner	Why is a gapper on the list, and is the volume real?
Options X-Ray	Which contracts are rich or cheap before you pick one?

Three questions before every trade

1. **Do the tools agree?** Price, volume, flow and levels pointing the same way is a stronger case than any one of them alone.
2. **Where am I wrong?** Define the price that proves the idea wrong before you enter.
3. **What is the most I can lose?** Size the position so that loss is acceptable.

Keep risk small and defined

A common rule of thumb among active traders is to risk no more than about 1% of the account on any single trade: the distance from entry to the stop, times the position size. With options, the simplest version is to limit the premium paid, or the maximum loss of a spread, to that amount. Check prices with your broker before acting; the tool refreshes every few minutes, and your broker's quote is the one you trade on.

Common mistakes

Mistake	Better habit
Treating a chip as a signal	Below VWAP or negative gamma describes the moment; it doesn't predict the next move.
Ignoring the distance to the level	A stop 0.1% away and one 3% away are different trades. Size for the stop.
Trusting an old X-Ray count	Check the X-Ray scan tile; the counts are from the last after-the-close scan.

APPENDIX A

Quick reference

Settings, terms and formulas for Clear View.

SETTINGS

Setting	Value
Tickers	Your watchlist plus tickers you add here (up to 25), saved in this browser
Groups	Watchlist, top gappers (Gap Scanner), Gamma Levels sweep
Today	VWAP, pre-market high and low, 15-minute opening range (5-minute while it forms)
Nearest levels	Closest daily support and resistance zones
Expected move	Next weekly or monthly expiration's straddle
More columns	Off by default: gap and RVOL, IV / RV, X-Ray
Market regime	SPY 20-day realized volatility: calm < 12%, normal 12–20%, volatile > 20%

GLOSSARY

Call wall
The strike at or above the current price with the most call open interest.

Expected move
The size of move the options market is pricing by an expiration, in either direction. Usually the at-the-money straddle.

Gamma flip
The price at which estimated total dealer gamma changes sign.

Opening range (OR)
The high and low of the first 5 or 15 minutes of the regular session, which opens at 9:30 am ET.

Pre-market range (PM)
The high and low traded before the 9:30 am ET open.

Put wall
The strike at or below the current price with the most put open interest.

Relative volume
Today's volume so far divided by the 20-day average daily volume.

Support and resistance zone
A price band where the stock has turned several times: support below the price, resistance above it.

VWAP
Volume-weighted average price: the average price paid for every share traded today.

METHODS

Figure	How it is calculated
Today's levels	VWAP, the pre-market high and low and the 5- and 15-minute opening ranges come from 1-minute bars, refreshed about every minute.
Nearest levels	The daily zones (see Zones) re-picked against the latest price: the closest zone above is resistance, the closest below is support.
Zones	Swing highs and lows (bars higher or lower than the bars on each side) are grouped when they fall within half an average true range of each other. Each group is a zone; touches is the number of swing points in it.

Straddle move	At-the-money call + put at the quote midpoint, interpolated between the strikes around the price. Range = price ± straddle.
Dealer gamma	Black-Scholes gamma × open interest × 100 × price² × 1%, giving dollars of hedging per 1% move. Calls count positive and puts negative (dealers assumed long calls, short puts).
Gamma flip	Total dealer gamma is recalculated at prices from −10% to +10% of the current price in 0.25% steps, holding open interest and implied volatility fixed. The flip is the sign change closest to the current price.
IV / RV	IV30 ÷ 20-day realized volatility. 1.2× or more reads rich, 0.85× or less cheap.
Market regime	SPY's 20-day realized volatility: calm below 12%, normal from 12% to 20%, volatile above 20%.
